Summary

Chingiringi Affiliate Flow

From User Click to Coin Redemption — Both Integration Paths

Two parallel affiliate tracks, one shared user experience. This document walks through every step from a user tapping a product link to receiving money in their UPI account.

The two paths at a glance

Why two paths:

- **Cuelinks** covers Myntra, Flipkart, Meesho, Ajo, Nykaa and 1,000+ other Indian merchants in a single integration. They take ~20% of every commission as their fee.
- **Amazon Associates** is direct. No middleman. We register with Amazon, get our publisher tag, keep 100% of the commission Amazon pays. Best margins.

Both paths feed the SAME user experience: tap a deal, buy, earn coins, redeem for ₹.

PATH A: CUELINKS (Myntra / Flipkart / Meesho / Ajio / Nykaa / etc.)

Step 1 — Setup (one time)

We register Chingiringi at **cuelinks.com**:

- Pick our publisher type (mobile app + website)
- Submit our domain / app links for verification
- Get a **Cuelinks publisher ID** (e.g., `cuelinks-chingiringi-12345`)
- Apply to each merchant inside the Cuelinks dashboard (“offers”)
- Each merchant approves us (usually 24-48 hours)

We add Cuelinks merchant URLs to our admin: every Myntra / Flipkart / etc. deal gets the Cuelinks-formatted URL pasted into the deal’s `affiliateUrl` field.

Step 2 — User clicks a deal in Chingiringi

User browses Chingiringi, taps “Shop Now” on the **”Myntra: Flat 20% Cashback”** deal.

What happens behind the scenes:

1. App calls our backend: "User U clicked deal D"
2. Backend logs a ClickEvent: { user, deal, merchant=myntra, time }
3. Backend rewrites the affiliate URL with the user's tracking tag:
`https://linksredirect.com/?...&subid=cr_<U>`
4. Backend returns the rewritten URL to the app
5. App opens the URL in the browser

The whole round-trip takes ~200ms — invisible to the user.

Step 3 — User lands on Myntra (via Cuelinks)

Cuelinks 302-redirects the user to Myntra. Two cookies drop:

- **Cuelinks’s tracking cookie** — knows the click came from us
- **Myntra’s session cookie** — tracks the user on Myntra

The user is now on Myntra’s site. They browse, add items to cart, check out.

Step 4 — User buys

User completes the purchase. Order total ₹2,000.

Myntra pays a commission to Cuelinks based on category (let's say 8% for fashion = ₹160).

Cuelinks's report shows:

Field	Value
Order ID	MYN-9X8B-A4
Sub-ID	cr_64f8a2b9c1d2e3f4a5b6c7d8
Sale amount	₹2,000
Commission earned by Cuelinks	₹160
Cuelinks's cut (20%)	₹32
Commission paid to us	₹128
Status	Pending

Step 5 — Admin imports the Cuelinks report

Cuelinks publishes reports weekly. Admin opens the **Wallet Operations Hub** → **Reports Inbox** tab:

- Picks “Cuelinks (aggregator)” from the merchant chip selector
- Pastes the CSV from the Cuelinks dashboard
- Clicks **Parse Report**

Preview shows every row matched via the `cr_<userId>` subsid. Admin clicks **Import**.

Step 6 — Coins credited (pending for 30 days)

For each matched row, the system:

- Calculates coins owed: `commission × passThroughPercent × coinsPerRupee`
- Default: 25% pass-through, 10 coins per ₹ → for ₹128 commission, user gets **320 coins** (≈ ₹32)
- Creates a pending Transaction with a 30-day lock (matches Myntra's return window)

- Adds 320 coins to the user's wallet immediately so they SEE the pending balance

The 30-day lock matters: Myntra can cancel the order or accept a return during this window, in which case Cuelinks marks the row CANCELLED in the next report and we'd need to reverse the credit.

Step 7 — Coins confirm after 30 days

The lock expires. The pending Transaction flips to `confirmed`. The user can now withdraw against these coins.

Step 8 — User requests withdrawal

User opens Chingiringi, taps **Withdraw Money**, enters 320 coins. App shows them:

| Withdraw 320 coins → ₹32 to your UPI

User picks UPI, enters their VPA, confirms.

Step 9 — Admin processes payout

The request lands in the admin's Pending Queue. Admin opens the user, sees the request at the top, transfers ₹32 from their bank app via UPI, pastes the UPI reference number, clicks **Approve & Pay**.

System debits 320 coins from the user's wallet, marks the transaction completed.

Step 10 — Cuelinks pays us (later)

Cuelinks aggregates and pays us monthly into our bank account. **Typical timing: 45-60 days after the order's status flipped to confirmed.**

So our cash from Cuelinks arrives AFTER we already paid the user. We're floating the user's payout. (See "Working Capital" below.)

PATH B: AMAZON DIRECT (Amazon Associates)

Step 1 — Setup (one time)

We register at affiliate-program.amazon.in:

- Submit our app + website
- Verify ownership
- Get our **Amazon Associate Tag** (e.g., `chingiringi-21`)
- **No per-merchant approval needed** — once accepted, we can promote anything on Amazon

We need to maintain at least 3 sales every 180 days or Amazon closes the account. With Chingiringi's traffic this is trivial.

Step 2 — User clicks an Amazon deal in Chingiringi

Same as Cuelinks — App calls backend → ClickEvent logged → URL rewritten → opened.

The URL format is different:

```
https://amazon.in/dp/B0XYZABC123
?tag=chingiringi-21
&ascsbtag=cr_<userId>
```

- `tag` — our Amazon publisher ID (Amazon uses this to know it's us)
- `ascsbtag` — our user tracking ID (Amazon echoes this back in reports)

Step 3 — User lands on Amazon

Amazon drops their cookie. **24-hour attribution window** — anything the user buys on Amazon within the next 24 hours is credited to us (not just the product they clicked).

User browses, buys whatever. Order total ₹1,500 (different product than the one they clicked).

Step 4 — Amazon tracks the order

Amazon's affiliate report shows:

Field	Value
Order ID	405-1234567-8901234
ascsubtag	cr_64f8a2b9c1d2e3f4a5b6c7d8
Product	Bluetooth speaker (not what they clicked!)
Sale amount	₹1,500
Category	Electronics
Commission rate	1% (electronics)
Commission paid to us	₹15
Status	Shipped (will confirm after return window)

Amazon does the per-product, per-category commission math. Their commission column already reflects the right rate for the actual product purchased.

Step 5 — Admin imports the Amazon report

Same flow as Cuelinks:

- Wallet Operations Hub → Reports Inbox
- Pick “Amazon” from the merchant chip selector
- Two ways to get the data:
 1. **Manual:** download CSV from `affiliate-program.amazon.in` dashboard, paste it
 2. **Automated (Phase 4):** Amazon Reports API daily poll — fetches yesterday's orders automatically
- Parse → Preview → Import

The same `cr_<userId>` subid matching applies. Same coin formula: `commission × pass-ThroughPercent × coinsPerRupee`. For ₹15 commission → **37 coins** ($\approx$ ₹3.75).

User gets a smaller reward here because Amazon paid less commission (1% on electronics). That's fair — they bought electronics, we earned less.

Step 6-9 — Same as Cuelinks

Coins pending → 30-day lock → confirm → user requests withdrawal → admin pays out.

The user experience is identical. They don't know or care whether the order went through Cuelinks or directly to Amazon.

Step 10 — Amazon pays us (later)

Amazon pays monthly, **~60 days after the END of the calendar month** in which the order shipped.

- Order shipped Jan 15 → Amazon pays end of March
 - Minimum payout: ₹1,000 (₹100 for direct deposit in India)
 - Payment via bank transfer (NEFT)
-

Side-by-side comparison

Dimension	Cuelinks	Amazon Direct
Setup effort	1 hour signup + per-merchant approvals	30 min signup, no per-merchant approval
Merchants covered	Myntra, Flipkart, Meesho, Ajio, Nykaa, 1000+	Amazon only
Commission keep rate	~80% (they take 20%)	100% (no middleman)
Typical commission %	5-12% depending on merchant + category	0.5-12% depending on category
Payout cadence	Monthly, ~45-60 days after confirmation	Monthly, ~60 days after month end
Minimum payout	₹1,000	₹1,000 (NEFT)
Report format	CSV / dashboard	CSV / dashboard / API
Cookie window	Varies by merchant (7-30 days typical)	24 hours
TDS implication	TDS 5% above ₹15k/year on commission	TDS 5% above ₹15k/year on commission
Best for	Coverage breadth, fast launch	Margin, Amazon-heavy users

Strategy: use Cuelinks for the 4 non-Amazon merchants (Myntra, Flipkart, Meesho, Ajio) and Amazon directly. Best of both — broad coverage + best margins on the biggest single merchant.

Money flow: worked examples

Example 1 — Myntra fashion purchase (via Cuelinks)

User buys: ₹2,000 dress on Myntra

— Myntra commission (8% fashion):	₹160
— Cuelinks's cut (20%):	₹32
— Commission paid to us:	₹128
— User's coin reward (25% × 10): (= ₹32 redeemable)	320 coins
— Chingiringi's net keep:	₹96 (75% of what we earned)

Example 2 — Amazon electronics purchase (direct)

User buys: ₹1,500 Bluetooth speaker on Amazon

— Amazon commission (1% electronics):	₹15
— Commission paid to us:	₹15 (no middleman cut)
— User's coin reward (25% × 10): (= ₹3.75 redeemable)	37 coins
— Chingiringi's net keep:	₹11.25 (75%)

Example 3 — Amazon beauty purchase (direct)

User buys: ₹1,000 premium skincare on Amazon

— Amazon commission (10% luxury beauty): ₹100

— Commission paid to us: ₹100

— User's coin reward ($25\% \times 10$): 250 coins
(= ₹25 redeemable)

— Chingiringi's net keep: ₹75 (75%)

Settlement timing — the working capital reality

Day 0	User clicks, buys.	
Day 0	Merchant report arrives at Cuelinks/Amazon dashboard (some merchants take 1–7 days).	
Day 7	Admin imports report → user sees +320 coins (pending).	
Day 37	Lock period expires → coins confirmed.	
Day 40	User requests withdrawal of 320 coins (₹32).	
Day 40	Admin transfers ₹32 via UPI.	← OUR ₹32 PAID OUT
Day 60	Cuelinks/Amazon pays us their monthly cycle.	← WE RECEIVE OUR ₹128

The float: we pay the user on day 40 but get paid by the network on day 60. For 20 days, we're funding the user's payout from our own cash.

Working capital required:

At 100 daily orders × ₹50 avg commission × 25% pass-through = ₹1,250/day in user payouts.
With 20-day float, we need:

- ~₹25,000 reserve at any point in time
- Scales linearly: 10,000 daily orders → ₹2.5L reserve

Two ways to manage this:

1. **Hold a reserve** (recommended for growth): keep 2 months of expected payouts in the bank. Cleanest UX — user gets paid the day they request it.
2. **Hold user payouts until we're paid:** don't release coins for withdrawal until the network has settled the commission. Slower UX (60-day wait) but zero float risk.

Recommend Option 1 once monthly GMV is steady. Option 2 only if cash is genuinely tight.

The user experience (what THEY see)

This is the only thing the end user cares about. Both paths feel identical.

1. Open Chingiringi → browse deals
2. Tap "Shop Now" on a deal → land on Myntra / Amazon / etc.
3. Buy normally on that merchant's site
4. Hours later → notification: "320 coins pending – confirms in 30 days"
5. 30 days later → notification: "320 coins confirmed! Ready to withdraw"
6. Open app → tap "Withdraw Money" → enter coin amount
7. See: "Withdraw 320 coins → ₹32 to your UPI"
8. Confirm → see request status: "Processing"
9. Same day or next: ₹32 arrives in their UPI
10. Notification: "Withdrawal complete. ₹32 sent to rahul@paytm. TXN: XXX"

User never sees Cuelinks. Never sees Amazon Associates. Never sees commissions or pass-through rates. Just: I bought, I got coins, I got money.

Admin's daily workflow

Morning routine (5 minutes):

1. Open Wallet Operations → Pending Queue
2. See: "3 withdrawals waiting · 12 lock-expired txns ready to confirm"
3. One by one:
 - Tap a withdrawal → user page opens → transfer via UPI → paste TXN id → done
4. Tap "Confirm All" (Phase 3) on expired lock txns

Weekly routine (15 minutes):

1. Log into Cuelinks dashboard → download weekly CSV
2. Wallet Ops → Reports Inbox → pick Cuelinks → paste → Import
3. Log into Amazon Associates → download daily/weekly CSV
4. Wallet Ops → Reports Inbox → pick Amazon → paste → Import
5. Review unmatched rows (typically <5%) → manual assign if obvious

Monthly:

1. Reconcile bank deposits from Cuelinks + Amazon
2. Adjust working capital reserve if needed

Total admin time at 100 users: ~3 hours/week. At 10,000 users: ~10 hours/week. Linear, predictable, no per-user manual work.

Edge cases

Situation	What happens
User clicks but doesn't buy	Click logged, no row in merchant report, no coins. Click data still useful for analytics.
User clicks, buys, returns within 30 days	Merchant report shows REJECTED on next cycle. Admin reverses the credit. User's pending coins disappear.
User clicks Myntra but our subid got stripped (rare)	Row arrives without subid. Lands in Unmatched. Phase 3 click-log fallback recovers via time+amount match.
Two users on same WiFi click same deal	Each has their own userId in the subid → separate attribution. No problem.
User clears cookies between click and purchase	Lost attribution. Merchant sees no source → no commission → no row in report → no coins. Unavoidable industry-wide.
Cuelinks payment delayed	We've already paid the user. Float increases until next settlement.
Fraud (user using stolen card, charges back)	Merchant report marks REJECTED. We reverse user's pending coins. If already confirmed → admin manually debits and notes the case.

Summary

Two integration paths, one user experience.

Path	Use for	Margin	Setup
Cuelinks	Myntra, Flipkart, Meesho, Ajio, Nykaa, etc.	~80% of commission earned	1 hour + per-merchant approvals
Amazon direct	Amazon (highest-volume single merchant)	100% of commission earned	30 min, instant

The economics: at default 25% pass-through, we keep 75% of every ₹ of commission we earn. User gets coins worth 25%. That's the sustainable share.

The cash flow: we pay the user within days of confirmation, but the network pays us 30-60 days later. Need a working-capital reserve equal to ~2 months of expected payouts.

The admin work: ~3 hours per week at small scale. Scales linearly to ~10 hours per week at 10,000 users. No per-user manual entry — everything is bulk import + queue-based action.

The user sees: click → buy → coins land → wait 30 days → withdraw → money in UPI. Same flow for every merchant, every category, every order. They never see the plumbing.
