

Chingiringi — Test Findings Summary

QA · 2026-07-16 run

July 17, 2026

Chingiringi — Test Findings Summary

Focused extract from the [Manual Test Plan](#) — **only the items that need attention** from the 2026-07-16 run: bugs/issues, partially-verified cases, and deliberately-skipped cases. Full pass details live in the main plan.

Run: 2026-07-16 · frontend `localhost:8082` (Expo web) ↔ backend `localhost:8000` (MongoDB Atlas, live data) · desktop 1440x920 · accounts `admin@gmail.com`, `vcrohithuta@gmail.com`.

Group	Count	Meaning
🔴 Bugs & issues	1-bug fixed + 4 issues (+1 new)	Something is broken or wrong — needs a code/copy fix
🟡 Partial	7 → 3 left	Works but only partly exercised — needs follow-up verification
🔵 Skipped	6	Deliberately not run this pass (destructive, mutates config, or not drivable in the in-app browser)

Update — 2026-07-16 (fixes applied): The one 🔴 bug (§1.1) is **fixed & verified**. Four partials resolved to PASS (§2.8 open product, §3.1 detail, §6.4 open deal, §14.1 Users). Remaining partials: §4.4 withdraw overlay and §15 steps 6–8 (blocked by `window.prompt` on web — see new item 1.6) plus §8.2 About. QA test data created during testing was cleaned up afterward.

1. 🔴 Bugs & issues

1.1 ✅ FIXED (WAS 🔴 BUG) — REPORT IMPORT: NO SUCCESS CONFIRMATION/AUDIT ON A DEAL-LINKED MATCH

- **Fixed & verified 2026-07-16:** added `subid+click` and `click_log_fallback` to the `matchedVia` enum in `reportImportModel.js`. A re-import now shows a success card **and** a “Past imports” audit entry. Ready to deploy (prod still has the bug until pushed).
- **Where:** Admin → Wallet Ops → Reports Inbox → Import (*plan §12.3 / §17.1*)

- **What happens:** Importing a report row that matches by subid **and** has a recent deal-linked click **credits the coins** (wallet `pendingCoins += N` and a `coin_credit` transaction are written), but the `ReportImport` **audit document fails to save** — so the admin sees **no success card and no “Past imports” entry**.
- **Root cause (code trace):** the controller sets `row.matchedVia = 'subid+click'` (or `'click_log_fallback'`), which is **not in the schema enum** `['subid', 'click_log', 'manual', 'none']` (`backend/src/modules/admin/reportImportModel.js` ~line 24). `ReportImport.create()` throws a Mongoose `ValidationError` **after** the wallet/transaction writes already committed (`walletOpsController.js`, sets `matchedVia` ~:609–611, creates the audit ~:622).
- **Observed:** the import credited **+440 pending coins** (visible on the user wallet + admin timeline) yet produced **no “Past imports” row**; the accidental re-import was then correctly **deduped** (“1 failed — duplicate”).
- **Impact:** silent success — the user is credited, but there’s **no confirmation and no audit trail**. No double-credit (dedup protects that), but reconciliation is broken.
- **Fix:** add `'subid+click'` / `'click_log_fallback'` to the `matchedVia` enum, **and/or** wrap the wallet credit + transaction + audit write in one DB transaction so they commit or roll back together.

1.2 🟡 ISSUE — COIN FORMULA: LIVE CONFIG, UI COPY, AND DOCS ALL DISAGREE

- **Where:** Reports Inbox help text + coin economy config (*plan §12.9 / §17.2*)
- **The three numbers:** the Reports Inbox help says “**commission × 10 coins**”; the plan §0 default says **pass-through 25%** (→ ×2.5); the **live credit was 440 for ₹200 → effective ×2.2 (pass-through ≈22%)**.
- **Fix:** confirm the intended pass-through, set it in Wallet Ops → Settings, and fix the help copy (it omits the pass-through factor entirely).

1.3 🟡 ISSUE — CURRENCY SYMBOL ON A COIN AMOUNT

- **Where:** User wallet → Transaction History row (*plan §4.2 / §17.3*)
- **What:** the transaction row shows “**+₹440**” while the Pending Coins card correctly shows “**440 coins ≈ ₹44**”.
- **Fix:** the row should read coins (“+440 coins”) or the rupee value (“+₹44”), not “+₹440”.

1.4 🟡 ISSUE — ADMIN USER-WALLET TILES DON’T SURFACE PENDING COINS

- **Where:** Admin → Wallet Ops → User Wallet (*plan §12.5 / §17.4*)

- **What:** the four summary tiles read **COINS 0 / PENDING ₹0** even when the timeline shows **+440 pending coins**. The “PENDING” tile is rupees-only, so pending coins appear in no tile.
- **Fix:** add a pending-coins figure to the admin summary tiles.

1.5 🟡 DATA — STALE TEST DEAL

- **Where:** Admin → Deals (*plan §6.5 / §17.7*)
- **What:** the “Headphone” deal expired **15/07/2026** (a day before the run), so it’s correctly hidden from users but still shows to admin.
- **Fix:** bump its expiry if it should remain visible (not a code bug — stale data).

1.6 🟡 ISSUE (NEW) — ADMIN WALLET ACTIONS USE `WINDOW.PROMPT` ON WEB

- **Where:** Admin → Wallet Ops → **Credit/Debit Coins** and withdrawal **Approve & Pay** (`WalletOperationsScreen.tsx:76, :928, :1023`).
 - **What:** the “native prompt” helper falls back to `window.prompt` on web (a proper modal exists only for iOS/Android).
 - **Impact:** clunky desktop UX, and these flows can’t be driven by automation — which **blocked the §4.4 / §15 steps 6–8 verification**. Consider reusing the in-app modal on web.
-

2. 🟡 Partial — works, but only partly verified

Resolved 2026-07-16: §2.8, §3.1, §6.4, §12.3, §14.1 → **PASS** (see the striked rows). **Left:** §4.4, §15 steps 6–8 (blocked by §1.6), and §8.2 About.

#	Case	✅ Verified this run	⌚ Left to verify
2.8	Open a product	Product/deal cards render with correct data	Tapping a card did not fire navigation in the automated browser (RN-web synthetic-click quirk, §17.8) — confirm on a real device / Expo Go
4.4	Withdraw funds overlay	The Withdraw Funds button renders	With ₹0 balance the click is a no-op (correct guard); open + drive the overlay once the account has a withdrawable balance
6.4	Open a deal	Deal cards render (brand, cash-back %, days-to-expiry); the Shop-Now network path is verified separately (§3.2)	Tap-to-detail didn't fire in automation (same §17.8 quirk) — confirm manually
8.2	About	About + legal links (Affiliate Partners, Terms, Help, Privacy) present on Profile	Open the About screen and confirm app-info content
12.3	Reports Inbox — import credits coins	Credit works: +440 pending coins landed, <code>coin_credit</code> txn created, visible on user wallet + admin timeline	The success/audit path is broken on deal-linked matches → see Bug 1.1
14.1	Users list	Real users returned via Wallet Ops → User Wallet search (two “Rohit Hutagonna”)	Open the dedicated Users screen; confirm empty state + search there
15	End-to-end affiliate flow	Steps 1–5 PASS: deal → click (subid) → CSV import → +440 pending coins visible to user	Steps 6–8: run <code>npm run cron:confirm-locks -- --force</code> (lock → withdrawable), then user withdrawal → admin approve & pay

3. Skipped — deliberately not run this pass

#	Case	Why skipped	How to test properly
1.3	Login — OTP	OTP delivery not exercisable in this environment	Use a real phone/number with SMS; verify send + correct/incorrect OTP + <10-digit block
1.4	Login on Safari	The in-app browser is Chromium, not Safari	Log in on desktop/iOS Safari; confirm wallet/profile load with no 401s (the Bearer-token / ITP fix)
1.8	Delete account	Destructive — removes an account	On a throwaway account: pick a reason, confirm “Delete Forever” only enables after a reason, then delete
5.2	Edit profile — avatar upload	OS file picker can’t be driven from the in-app browser	Web: upload a file → Cloudinary → preview. Native: photo-library permission → pick → upload
11.3	Configure Razorpay	Saving would mutate live payment config	On a staging config: save keys, reopen to confirm the secret is masked (<code>.....1234</code>), blank-on-resave keeps the stored secret
13.5	Image upload (all forms)	OS file dialog not drivable in the in-app browser	Web file picker + native photo picker + “paste image URL” fallback across deal/product/banner forms

Suggested priority

1.  **Bug 1.1 fixed — deploy it** (prod still has the `matchedVia` enum bug until this pushes).
2. **Reconcile the coin formula (1.2)** — three sources disagree; pick the source of truth and align copy + config + docs.
3. **Move web wallet actions off `window.prompt` (1.6)** — unblocks §4.4 / §15 steps 6–8 and improves desktop UX.
4. Polish the two display issues (1.3, 1.4) — small, user-visible.
5. Complete §4.4 / §15 steps 6–8 on native / real device (or after 1.6), and run the  skipped set (OTP, Safari, uploads).
